Before toning ensure the print is completely washed.

For preparing working solution distilled water is recommended.

IMPORTANT: the working solution must be made using the following sequence:

Water	840ml
Part1	160ml
Part 2	80ml
Part 3	80ml

The shelf life of the working solution is dependent upon the dilution and usage. As soon as the colour of the working solution changes from green to red-brown and a copper coloured precipitate appears, either filter it using a coffee filter or throw it away.

The toning time is between 30 seconds and 2 minutes. Stop toning when the middle tones start to be affected; extended toning causes loss of contrast, shadows to lighten and the unexposed edges of the print may become slightly coloured. It is possible to maintain shadow depth with intensive copper toning by using a short selenium toning before washing.

Experiment also with greater dilutions.
